

# Skewb Ultimate

**a.k.a. Pyraminx Ball**

*Purchased from Meffert's 2008.*

(plastic, 3 inches between opposite faces)

There are twelve faces and six colors (*red, blue, green, orange, yellow, and pink*). When solved, each pair of opposite faces is the same color. Like the *Skewb Diamond*, rotation is not about the points, rather it is along each of the four planes that cuts the puzzle in half, and this puzzle is a variation of the *Skewb*. However, *Jaap's Page* explains that this puzzle is harder because orientation of the components of a face matters, and presents a solution. Mefferts also made this puzzle in a 12 color version (yellow opposite white, light green opposite dark green, pink opposite purple, orange opposite light purple, gold opposite red, light blue opposite dark blue); here are views of the front and back:
