

Trends in Natural Language Processing

With the exponential growth in the amount of online material, most of them in textual form or text combined with other media (visual, audio), the interest in tools for managing, mining, organizing, and ultimately understanding such material is higher than ever. The special track on Trends in Natural Language Processing was conceived as a forum for presenting tools and innovative ideas from the domains of natural language processing and computational linguistics, for helping us deal with this enormous amount of data. The papers cover topics ranging from analyzing writing styles, to adaptive question answering systems, to computer generated jokes.
