Rubik's 3x3x3 Cube

*Patent filed by Erno Rubik 1975, sold by Ideal Toys in the 1980's.*
(plastic with colored stickers, 2.2"; keychain 1.2")

The first puzzle of this type in a large class of puzzles in the years to follow. Challenging and fun to play with. One can rest at any time and pick it up later. A number of ways to construct this puzzle have been devised over the years; here are the pieces of an original Rubik's Cube like shown above, where there is a central axis assembly and 20 pieces that interlock with it.

*Copyright J. A. Storer*
Rubik 3x3x3 Six Step Solution

**Notation:** L (left), R (right), F (front), B (back), U (up), D (down) for 90 degree clockwise rotation of that face; - means counterclockwise and a 2 means do it twice. Corners are named with three letters and edges are named with two letters (e.g., FR means looking at the front, it is the edge on the right).

1. Solve the top layer (all of it, including the sides), and turn the cube over so now it becomes the bottom layer and the bottom third of the cube is solved (easy with a little practice).

2. Solve the middle layer:
   Rotate the middle so centers are correct, and then move edges between the up and middle layers until the middle is solved. If an edge first needs to be flipped, move it be FU and do the edge flipper sequence of Step 3 (the edge be flipped, and you can rotate the top to move it back to be FU). Parentheses are just to make the sequence easier to read.

   **edge mover, FU -> FR:** (U R) (U- R-) (U- F-) (U F)

3. Flip the up edges so they all have the correct color on top:
   If no up edges have correct top color, first do the edge flipper. Now position the cube so UL has correct top color and UF does not, and do the edge flipper at most two times.

   **edge flipper:** F (R U) (R- U-) F-

4. Move the up layer edges to their correct positions:
   As needed, re-position the cube and use the edge swapper sequence.

   **edge swapper, UF<->UL:** (R U) (R- U) (R U^2) (R- U)

5. Position the up layer corners:
   The corner cycle sequence leaves UFR alone and cycles the other three counterclockwise. Identify one corner that is correct (but may be rotated), or if there is not one, do the corner cycle. Then re-position the cube so the correct corner is UFR, and then do the corner cycle one or two times to make all corners correct.

   **corner cycle:** (U R) (U- L-) (U R-) (U- L)

6. Rotate the up layer corners (read this whole step before starting it):
   ***Don't worry that the bottom is mixed up as you do this, it will be ok in the end.***
   Position the cube so UFR is not correct and repeat steps A and B until all corners correct:
   
   A. Repeat the corner rotator until the UFR corner is correct:

   **corner rotator:** R- D- R D

   B. Rotate the up layer (not the whole cube) so that UFR is incorrect.

**Remembering The Basic Rubik 3x3x3 Six Step Solution**

Each sequence has a natural rhythm, but an easy mistake is to start off wrong. The Edge Mover and Corner Cycle start with U, the Edge Flipper (after parking the F) and the Edge Swapper start with R. To avoid forgetting your place, run the sequence in your head, and when you get faster, simply count 1,2,3,4,... as you go; 8 for the edge mover, edge swapper, and corner cycle; 4 between the F's of the edge flipper; 2 sets of 4 for the corner rotator.

*Edge Mover (for Step 2):*

```plaintext
ege mover, FU -> FR: \( (U \ R) \ \ (U^\cdot \ R^\cdot) \ \ (U^\cdot \ F^\cdot) \ \ (U \ F) \)
```

It starts with a U, and every other move involves a U or U-

First two moves and last two moves are clockwise, middle four moves are counter clockwise.

First 4 moves involve R, second 4 moves involve F.

*Edge Flipper (for Steps 2 and 3):*

```plaintext
edge flipper: \( F \ \ (R \ U) \ \ (R^\cdot \ U^\cdot) \ \ F^\cdot \)
```

"Park" the front with F, do \( (RU) \ \ (R-U) \), and then "unpark" the front with F-

*Edge Swapper (for Step 4):*

```plaintext
ege swapper, UF<->UL: \( (R \ U) \ \ (R^\cdot \ U^\cdot) \ \ (R \ U^2) \ \ (R^\cdot \ U) \)
```

It's R R- R R- interleaved with U U U^2 U.

The R's alternate + and -, and the U's keep going clockwise, where the third is 180 degrees.

*Corner Cycle (for Step 5):*

```plaintext
orner cycle: \( (U \ R) \ \ (U^\cdot \ L^\cdot) \ \ (U^\cdot \ R^\cdot) \ \ (U^\cdot \ L) \)
```

It's U U- U U- interleaved with R L- R- L.

*Corner Rotator (for Step 6):*

```plaintext
corner rotator: \( R^\cdot \ \ D^\cdot \ \ R \ \ D \)
```

Always complete this sequence before doing Step 6B; it is easy to forget the final D when you see the correct color on top.

It will be done twice (eight moves to rotate once) or 4 times (16 moves to rotate twice).

---

Speeding Up the Basic Rubik 3x3x3 Six Step Solution

Step 1: Pick a color for this face that is easiest to locate quickly (e.g. white). Some people like to work from one corner, placing adjacent squares one at a time. Others like to solve the top edges first (forming a cross) and then it is easy to rotate the corners up.

Step 2: Instead of using the edge flipper, learn the symmetric sequence that moves an edge down counterclockwise from up to middle:

\[
edge \text{ cc-mover, } UF \rightarrow MFL: \quad (U^- L^-) \quad (U \ L) \quad (U \ F) \quad (U^- F^-)
\]

Step 3: Before the final F-, if the right side of FR is not the top color, instead of wasting time to do F^- F, repeat the (R U) (R^- U-) before doing F^-.

Step 4: If more than two edges need to be exchanged, rotate the top layer so the UF edge is correct and just do the first 7 steps of the edge swapper. Omitting the last move of the Edge Swapper leaves UF unchanged and cycles the other three counterclockwise. So you are done if that was needed. Otherwise, it turns out that now a second edge swapper operation, possibly followed by a U-, will always suffice. However, if you are willing to remember yet another sequence, a second edge swapper operation can be avoided for the case that a clockwise cycle is needed by using this sequence:

\[
clockwise \text{ cycle } UL, UB, UR: \quad (R \ U^2) \quad (R^- U^-) \quad (R \ U^-) \quad R^-\]

Step 5: If no corners are correct, learn how to tell for which orientation of the cube the corner cycle will leave things so that a counterclockwise cycle will be needed. Or, if you have identified a correct corner and a clockwise cycle of the other three is needed, instead of doing the corner cycle twice (three times returns the cube to where it was), save time by reversing the sequence:

\[
reverse \text{ corner cycle: } (L^- U) \quad (R \ U^-) \quad (L \ U) \quad (R^- U^-)\]

Step 6: Every iteration of the corner rotator exchanges UFR and DFR, and repeating it 6 times returns the cube to where it was. Step 6A will use the corner rotator 2 times if the top color is on the right side of the UFR corner, or 4 times if it is on the front, in which case it is faster to do the reverse sequence 2 times (easy, start with D- instead of R- and everything follows):

\[
reverse \text{ corner rotator: } D^- \quad R^- \quad D \quad R
\]
The Corner Rotator - Why Step 6 Works

Step 6 is the same as Step 3 of the solution presented for Rubik's 2x2x2, and we repeat here the observations from that page:

- Step 6A affects only 4 corners by exchanging two front right corners and also exchanging the two back down corners.

- Doing Step 6A twice leaves corners in the same positions, except those four corners are rotated, and doing Step 6A six times leaves the corners the same as when you started.

- On the up layer Step 6 only modifies the front right corner.

- Since Step 6 started with the down corners correct, once three of the four up corners have been fixed, fixing the fourth up corner must leave the down layer correct. This is because when at every 6th move the two back down corners are correct, all that is left that could be incorrect are the two front right corners, but due to parity considerations, a completely solved puzzle except for two adjacent rotated corners is not possible (however, although not hard to overcome, this is not true for the Rubik 3x3x3 Void Cube).

- The only edge pieces that are affected are FR, RD, BD, which are on the lower two layers; they return back to where they were after 6 moves.
Solving Rubik's 2x2x2 With 3x3x3 Sequences

A completely solved 3x3x3 cube except for two adjacent corners exchanged is not possible due to parity considerations; that is, if just two adjacent corners are interchanged, then it must be that the edges are not completely solved. However, this is possible for the Rubik's 2x2x2 cube.

If you are fast with the Step 5 corner cycle sequence, and don't want to bother remembering the sequence to exchange two corners of a 2x2x2 cube (which corrupts edges when used with the 3x3x3 cube), Steps 1, 5, and 6 will solve the 2x2x2 cube, by using the corner cycle appropriately for Step 5:

The single swap is all that is needed, since it can be used 3 times for a diagonal swap and twice for a double swap. However, by using all three variations shown above, it is at most 9 moves for a single swap (8 moves for the corner cycle plus the final U) or 16 moves for the diagonal or double swap. Note each time a corner sequence or reverse corner sequence is done, the cube first needs to be repositioned so that the corner that does not move is in the UFR position. If you don't want to remember the reverse corner cycle, the second sequence of the double swap can be a standard corner cycle on D,B,A followed by a U^2; however, counting that final U^2 as two moves, it is no fewer moves than doing two single swaps.

Copyright J. A. Storer
A Corners-First Rubik's 3x3x3 Solution

Here is a different approach that starts with solving the corners, then the top and bottom edges, and finally the middle edges.

**Notation:** L (left), R (right), F (front), B (back), U (up), D (down) for 90 degree clockwise rotation of that face; a – means counterclockwise and a 2 means do it twice. Corners are named with three letters and edges are named with two letters (e.g., FR means looking at the front, it is the edge on the right).

1. Solve the corners using a solution for Rubik's 2x2x2.

2. Position up and down edges by moving to and from the middle layer:
   A. Cycle edges between the middle and up layers to get three up edges correct:
      
      \[\text{RB} \rightarrow \text{FU}, \text{FU} \rightarrow \text{FD}, \text{FD} \rightarrow \text{RB}: \text{FMF}^{-1}\]

      That is, repeatedly position the cube so that the edge to be moved is RB, rotate the U layer so that where you want to move it to is FU, and cycle.
   
   B. Turn the cube over, and repeat Step A.
   
   C. Move the edge that goes to FD to the FU position; then move final edge to FU.

3. Use this to flip up and down edges:

   **Flip the UF edge:** \[\text{F} \rightarrow \text{M} (\text{FM})^2 \text{F}^{-1}\]

4. Use rotations of the middle layer and these sequences to position middle edges:

   *Front back swap,* \[\text{LF} \leftrightarrow \text{LB}, \text{RF} \leftrightarrow \text{RB}: (\text{R}^2 \text{M}^2)^2\]
   
   *Clockwise cycle,* \[\text{RF} \rightarrow \text{LB} \rightarrow \text{RB} \rightarrow \text{RF}: (\text{R}^2 \text{M}) (\text{R}^2 \text{M}^{-1})\]

5. Use this to flip middle edges (for right to left diagonal, do \[B^2\] before and after):

   **Flip RF and RB:** \[(\text{R M}^{-1})^3 \text{R M}^2 \text{R (M- R)}^3\]

In the early 2000's, smoother working versions of Rubik's 3x3x3 were widely available, with screws / springs for adjustable tension and smooth turning even when layers are not exactly aligned (beveled interior corners in conjunction with the spring action give a minimal degree of automatic alignment). The Newisland cube shown above was a gift from a friend; it is smooth and quiet, comes with a storage bag and directions, and its literature explains PA plastic lower resistance, anti-popping, and internal construction. The less expensive Da Yan cube shown above has different but similar construction; here are photos of it apart:
Rubik 3x3x3 Assisted With Magnets

Besides more complex insides that include screws and springs, magnets have been used to give a nice click stop effect. It not only is a beautiful cube that is fun to use, but is preferred by some who do speed cubing.

"Valk 3", designed by Mats Valk, purchased from Amazon.com 2017.
(plastic, 2+3/16" square;
comes in a sturdy 3.75" square box with a magnetic lid
and a compartment in the bottom with extra stickers and springs)

Rubik 3x3x3 With No Center Assembly

The original Rubik cube as well as modern versions are all based on a center spindle assembly that connects the six center squares and holds the whole cube together where the other pieces flow around it.

The Rubik 3x3x3 Void Cube is based on a completely different idea. There are no centers (one can pass their finger through the cube in all three directions).

The Rubik 3x3x3 Edges Only Cube (a.k.a. cornerless void cube) uses the same mechanism and eliminates the corner pieces as well.

A (Physically) Large Rubik Cube

One way to measure larges is the dimension of the cube; for example cubes of size 33x33x33 have been made. But another measure is the physical size of the cube. This cube, made by Tony Fisher, is 1.57 meters (over 5 feet) tall:
